Concise explanation (relevant portions)

1. It is disclosed in the abstract that in transmitting frame by bridge, when frame having the same destination as in the destination of frame to be transmitted is stored in any one of transmission queues, the frame to be transmitted is sent to the transmission queues. And, when the frame having the same destination is not stored in any one of the transmission queues, then the frame to be transmitted is transmitted by selecting appropriate transmission queues (transmission line). In this regard, the prior art discloses to retain sequence palladium by transmitting the frame having the same destination to the same transmission queues, however in this invention, the frames even having the same destination, the frames are distributed into different transmission line to deliver, and retain sequence palladium by utilizing sequence information inserted in each frame.
